

Receive shipments at the **speed of speech.**

A voice copilot for the warehouse receiving dock. Workers say what arrived; it checks the purchase order, catches shortages and damage, posts the goods receipt and emails the vendor.

THE BUSINESS PROBLEM

The receiving dock is where inventory truth begins, or breaks.

Hands are full

Workers juggle boxes, pallet jacks and a scanner or clipboard. Data gets typed in later, from memory.

Miscounts spread

A wrong count at receiving becomes a phantom stock level, a failed pick and an unhappy customer.

Damage goes unrecorded

Writing up a damage report takes too long, so it's skipped, and the window to claim from the vendor closes.

Vendors never hear

Shortages sit in a spreadsheet. Nobody emails the supplier, so the company pays for goods it never got.

\$1.73T

lost every year to **inventory distortion** (out-of-stocks and overstocks) across global retail. Inaccurate stock records start at the dock.

WHY TODAY'S TOOLS FALL SHORT

Screens need hands. Legacy voice needs a script.

HANDHELD SCANNERS

Eyes down, hands busy

Scan, look at the screen, type the quantity, put the box down, repeat. Damage and exceptions need extra forms.

CLASSIC VOICE-DIRECTED SYSTEMS

Rigid command grammar

"Ready... four... two... confirm." Workers learn a fixed vocabulary. Natural speech, corrections and questions fall outside it.

PAPER AND MEMORY

Entered hours later

Counts are written on a packing slip and keyed into the ERP at the end of the shift, if at all.

What a receiver actually says:

"We got eighty controllers – sorry, eight zero – and forty-five sensors. Three of them are cracked."

Numbers, self-corrections and damage in one breath. That's the sentence a warehouse system should understand.

THE SOLUTION

DockVoice: talk to your ERP like you'd talk to a supervisor.

- 

Natural speech, hands-free
No commands to learn. Interrupt it anytime.
- 

Understands corrections
"Eighty... no, eighteen." The latest number wins, never added twice.
- 

Captures damage on the spot
Damaged units go to quarantine; the vendor is asked for replacements.
- 

Posts only after a spoken "yes"
Reads the receipt back first. Real GRN, inventory and discrepancies.

HOW IT WORKS

From truck to stock in one conversation.

THE DEMO MOMENT

Messy speech in. Clean ERP records out.

WORKER

We got 80 controllers, 45 sensors. Power modules are 80... no wait, 18.

record_received_quantities · power modules 80 → 18

WORKER

And three of the sensors are cracked.

record_damage · 3 sensors → quarantine

COPILOT

80 controllers, 45 sensors with 3 cracked, 18 power modules. Short 20, 5 and 2. Shall I post it?

WORKER

Yes, post it. Tell them we need the missing controllers by Friday.

Right: the email the agent sent, with the damage in the worker's own words

An AI that can't post what you didn't confirm.

Draft first, never direct

The agent edits a draft receipt. The ERP is only written when a receipt is posted, in a single database transaction.

Progressive tool reveal

The "post" tool doesn't exist for the model until the read-back has happened. It physically can't skip the confirmation.

Stale confirmations expire

Every change bumps a draft version. Correct a count after "yes" and the agent must read back again.

Business-rule guards

"80 of 20 ordered?" gets flagged. Damage can't exceed what arrived. Unknown items and wrong vendors are caught.

Full audit trail

Every tool call is logged with its arguments, result and timing, so each ERP change traces back to what was said.

Fuzzy but safe matching

"Power mods" resolves to Power Module 24V. If two items are equally likely, it asks instead of guessing.

Simple, secure, and free to host.

The voice layer that made this possible in **days, not months.**

One WebSocket, whole pipeline

Speech-to-text, LLM and text-to-speech behind a single connection. No stitching three vendors together.

Accuracy where it matters

Universal-3 Pro Streaming nails numbers, part names and PO codes: the details a warehouse can't get wrong.

Keyterms from live ERP data

We feed vendor names, items and open PO numbers as keyterms, plus a dock-specific transcription prompt.

Real turn-taking

Server-side turn detection and barge-in: the worker interrupts and the agent stops instantly. It feels like a colleague.

Tool calling built in

JSON-schema tools, mid-session tool updates for progressive reveal, and clean result timing.

Production-ready details

Single-use browser tokens, clean session end, resumable sessions and a flat per-hour price that's simple to budget.

Every spoken word becomes a correct record.

FOR THE WAREHOUSE

- **Faster dock-to-stock:** the receipt is posted while the pallet is still on the dock.
- **Accurate inventory:** counts captured at the source, with corrections handled.
- **Damage never slips through:** quarantined and documented on the spot.
- **Near-zero training:** workers just talk. No codes, no screens.

FOR THE BUSINESS

- **Vendor accountability:** shortages and damage emailed with a due date, every time.
- **Stop paying for missing goods:** discrepancies are on record before the invoice arrives.
- **Audit-ready:** every ERP change traces back to a spoken instruction.
- **Runs on free hosting:** React + FastAPI + Postgres.

15–35%

productivity gains reported for voice-directed warehouse work

~50%

less training time reported with voice systems

DockVoice brings those gains to receiving, with natural conversation instead of a fixed command set.

WHAT'S NEXT

From the dock to the whole warehouse.

LIVE TODAY

Receiving + damage

PO receiving, corrections, damage to quarantine, GRN, discrepancies, vendor emails.

NEXT

Voice put-away

"80 controllers to bin A-01-03. Say the check digits." Closes the inbound loop.

NEXT

Cycle counting

Count bins from a forklift, hands-free. Recount prompts on variance.

LATER

Multilingual crews

Workers speak their own language; ERP records stay consistent.

LATER

ERP connectors

Business Central, NetSuite and SAP instead of the built-in ERP.

LATER

Radios & phones

Same agent over a phone line (SIP), for docks without tablets.

Hands full? **Just say it.**

DockVoice turns the busiest, messiest moment in the warehouse into clean, confirmed ERP records.
