

● AssemblyAI Voice Agent Hackathon

Receive shipments at the **speed of speech.**

A voice copilot for the warehouse receiving dock. Workers say what arrived; it checks the purchase order, catches shortages and damage, posts the goods receipt and emails the vendor.

THE BUSINESS PROBLEM

The receiving dock is where inventory truth begins, or breaks.

Hands are full

Workers juggle boxes, pallet jacks and a scanner or clipboard. Data gets typed in later, from memory.

Miscounts spread

A wrong count at receiving becomes a phantom stock level, a failed pick and an unhappy customer.

Damage goes unrecorded

Writing up a damage report takes too long, so it's skipped, and the window to claim from the vendor closes.

Vendors never hear

Shortages sit in a spreadsheet. Nobody emails the supplier, so the company pays for goods it never got.

\$1.73T

lost every year to **inventory distortion** (out-of-stocks and overstocks) across global retail. Inaccurate stock records start at the dock.

THE SOLUTION

DockVoice: talk to your ERP like you'd talk to a supervisor.

- 

Natural speech, hands-free
No commands to learn. Interrupt it anytime.
- 

Understands corrections
"Eighty... no, eighteen." The latest number wins, never added twice.
- 

Captures damage on the spot
Damaged units go to quarantine; the vendor is asked for replacements.
- 

Posts only after a spoken "yes"
Reads the receipt back first. Real GRN, inventory and discrepancies.

HOW IT WORKS

From truck to stock in one conversation.

THE DEMO MOMENT

Messy speech in. Clean ERP records out.

WORKER

We got 80 controllers, 45 sensors. Power modules are 80... no wait, 18.

record_received_quantities · power modules 80 → 18

WORKER

And three of the sensors are cracked.

record_damage · 3 sensors → quarantine

COPILOT

80 controllers, 45 sensors with 3 cracked, 18 power modules. Short 20, 5 and 2. Shall I post it?

WORKER

Yes, post it. Tell them we need the missing controllers by Friday.

Right: the email the agent sent, with the damage in the worker's own words

Simple, secure, and free to host.

TECH STACK

Modern, typed, and free to run.

Every spoken word becomes a correct record.

FOR THE WAREHOUSE

- **Faster dock-to-stock:** the receipt is posted while the pallet is still on the dock.
- **Accurate inventory:** counts captured at the source, with corrections handled.
- **Damage never slips through:** quarantined and documented on the spot.
- **Near-zero training:** workers just talk. No codes, no screens.

FOR THE BUSINESS

- **Vendor accountability:** shortages and damage emailed with a due date, every time.
- **Stop paying for missing goods:** discrepancies are on record before the invoice arrives.
- **Audit-ready:** every ERP change traces back to a spoken instruction.
- **Runs on free hosting:** React + FastAPI + Postgres.

15–35%

productivity gains reported for voice-directed warehouse work

~50%

less training time reported with voice systems

DockVoice brings those gains to receiving, with natural conversation instead of a fixed command set.

Hands full? **Just say it.**

DockVoice turns the busiest, messiest moment in the warehouse into clean, confirmed ERP records.
